Summary

Backend engineer (Go, TypeScript) building data-intensive systems on ClickHouse, MySQL and PostgreSQL. Experienced in query optimization, database migrations, and multi-tenant SaaS, shipping end-to-end with remote teams across the US, UK and NZ.

Technical Skills

Languages: Go, TypeScript (Node.js), Java (Spring Boot), Python (FastAPI), SQL
Databases: MySQL, PostgreSQL, ClickHouse, Redis, SQLite, MongoDB
Infrastructure: Docker, Kubernetes, Temporal, RabbitMQ, CI/CD, AWS EC2, Fly.io, Linux
Libraries & APIs: tRPC, Prisma, GORM, SQLBoiler, WebSockets, Stripe, OpenAI API
Frontend: React.js, Next.js

Work Experience

Full-stack Engineer Aug 2025 – Present
TorahAnytime *United States, Remote*

Technologies: Node.js, TypeScript, MySQL, ClickHouse, tRPC, Next.js, Go, Kubernetes, Temporal

- Built a **Go** exporter that processed **6 million records in 12 minutes**, replacing a Node.js process that handled 300,000 records in 16 hours (∼**1,600x throughput**).
- Redesigned the app's **speaker section** end-to-end, building backend services that combine **ClickHouse** lecture queries with **MySQL**-backed content management, advanced filtering, and pagination.
- Optimized lecture discovery using **ClickHouse dictionaries**, window functions, and batched queries; implemented faceted filters and eliminated N+1 requests in topic-based recommendations.
- Built seasonal topic rows (current holiday and recent topics) backed by a **server-side cache shared across instances**, delivering **millisecond page loads**.
- Built speaker self-service workflows for featured classes, uploads, and banner placements, enforcing resource ownership, premium entitlements, and idempotent asset replacement.
- Contributed to migration of a legacy **Node.js** backend from **RethinkDB to MySQL**, improving maintainability and supporting production data workflows.

CRM Software Developer (Contract, Part-time) Nov 2025 – Present
MyCelebrantApp *New Zealand, Remote*

Technologies: Go, SQLite, SQLBoiler, TypeScript, REST APIs

- Built an end-to-end **bulk CSV import** that lets celebrants migrate **thousands of rows** of spreadsheet enquiries and bookings into a platform serving **thousands of users**, **removing a major onboarding barrier**; handles inconsistent headers, malformed dates/times, renamed packages and duplicate rows with row-level validation and resumable results review.
- Launched an **embeddable website enquiry form** (generated iframe snippet) that turns celebrants' websites into a **direct lead-generation channel** (**hundreds of leads** captured to date), converting submissions into structured ceremony records with package defaults, venue coordinates and referral-source attribution.
- Automated lead follow-up so every submission triggers in-app chat messages, notifications and a **branded client-portal invitation**, shortening the path from enquiry to active client collaboration.
- Secured public lead-capture endpoints with tenant-scoped package validation, subscription enforcement, server-side validation, and **IP/form-based rate limiting**.
- Owned features across the full stack (schema design, **Go** APIs, **TypeScript** UI, access control, **transactional record creation** and automated tests); extended the platform to multiple ceremony types (weddings, funerals) with configurable template automation and client file uploads.

Backend Engineer (Contract) Jul 2025 – Aug 2025
Scrubbe *United Kingdom, Remote*

Technologies: TypeScript, Node.js, Prisma, REST APIs, Slack API, GitHub Actions, GitLab

- Led development of **Ezra**, an **LLM-powered assistant** that converts plain-English requests into backend log queries, letting engineers investigate issues without writing queries by hand.
- Implemented **real-time streaming responses** that summarise fetched logs and flag anomalies, rendered in multiple output formats based on how the user wants results displayed.
- Designed incident-management workflows with SLA tracking, automated alerts, and structured resolution processes.
- Integrated deployment and collaboration services to detect failed builds, create incidents, and update status through Slack.

Full-stack Engineer (Freelance) Jan 2024 – Apr 2025

Independent Clients *Ikeja, Nigeria*

Technologies: React.js, TypeScript, Express.js, Redis, Docker

- Developed a containerized e-commerce platform with session management and product caching using **Redis**.
- Optimized server-side caching and frontend product delivery, improving performance and reducing infrastructure overhead.

Software Developer Jan 2024 – Mar 2024

The Tann Mann Gaadi *Remote*

Technologies: Frontend development, API integrations, Figma

- Improved integration reliability by aligning frontend implementations with shared API contracts and delivered responsive interfaces from Figma designs.

Projects

Jottaware | *Go, Fiber, PostgreSQL, React.js, TypeScript, Docker* | **Website** 2026

- Architected and built a **multi-tenant SaaS workspace** for client, project, task, note, time-tracking, and reporting workflows.
- Implemented tenant-scoped APIs, **JWT authentication**, database migrations, scheduled jobs, file uploads, and PDF reporting.
- Built **WebSocket-based client messaging** with read states and notifications; deployed the containerized backend to **Fly.io** and frontend to **Vercel**.

Talewhirl-bsn | *Java, Spring Boot, PostgreSQL, Docker* | **GitHub** Sep 2024 – Dec 2024

- Built an open-source social-book platform API with authentication, email verification, and a relational schema spanning **30+ tables**.
- Documented APIs with **OpenAPI**, containerized the service, and configured CI/CD for automated deployment.

Education & Certifications

New Horizons Computer Learning Centers May 2024 – Oct 2024

Software Engineering (Java Technology) – Certificate *Ikeja, Nigeria*
